ABSTRACT: Self-efficacy is a factor in achieving the goals, including the most important issues in humanities research. The amount of a person's belief in his ability to organize and manage the resources needed to produce gains act designated person in connection with the self. One of the areas that are most affected by self-efficacy is work and jobs. Career self-efficacy as a belief about ability to have a successful career experiences, such as choosing a job well done and the insistence and persistence in the job. Whatever career path is greater feelings of self-efficacy, indicating a greater interest in their jobs. In contrast, feelings of low self-efficacy may limit the extent of occupational activities and, ultimately, lead to uncertainty regarding job duties.

Key words: Self-efficacy, Career self-efficacy, Bandura theory, Occupation, self-efficacy factors

INTRODUCTION

Self-Efficacy is one of the concepts applied in human science research that has been introduced for the first time by "Bandura". According to this theory, behavior change and maintain the function of the individual's expectations about their ability to perform certain behaviors, and expectations about the outcome it is behavior. Bandura (1997) argues that self-efficacy expectations are mediators of behavior and behavior change. Furthermore, Bandura (1997) points out that one of the important roles of a consultant to assist the authorities in order to increase self-efficacy expectations with regard to the scope of the target behavior, the effectiveness of interventions based on the data sources, ie, previous performance, learning, success, emotional arousal and emotional arousal - physiologically.

With regard to efficacy, many studies have been done, including Lentt and Hackett (1987) expressed the Career self-efficacy is an important variable that has been studied by career researchers. In fact, Career self-efficacy has been studied in relation to variables such as education and career choices (Betz and Hackett 1981), professional identity (Robins, 1985), consistent career (Betz and Fitzgerald, 1993). Academic achievement and persistence (Lent et al., 1986) and career decisions (Taylor and Popma, 1990). In this paper, the theory of self-efficacy has been studied by Bandura. The impact factors of self-efficacy are evaluated on Career self-efficacy.

Self-efficacy theory

Efficacy of Bandura (1977) refers to a person's beliefs or judgments of his or her abilities to perform the duties and responsibilities. The amount of confidence and belief in one's ability to perform a series of tasks successfully and obtain the desired result determines who is self (Bandura, 1977, 1993, 1997). Demonstrate the efficacy of the person making a decision to do or not to work. Belief in the efficacy of how people feel, think their motives are and how they behave, have a large impact. Bandura's theory of self-efficacy as a person's cognitive knowledge and experience by increasing the lifetime obtained is described. This experience leads to a direction that a person feels successful or not be able to do it (Bandura, 1977, 1986). People who have high self-efficacy are likely to do something to try too successful. Whereas, those who have low self-efficacy are difficult to do because most people who have a doubt, we are conflicted within him. Thus the idea is having a large impact on people's self-efficacy.

Sources of efficacy

Bandura's theory is of the opinion that the primary efficacy can be increased through four stages:

1-Tasks and successful past experiences
2-Substitution or observational learning experiences, through observing and modeling the behavior of others to make them.

3-The social impact of verbal incentives to meet their abilities and encourage the others

4-Evoked emotions like anxiety and other negative psychological states, this factor is based on the belief that an increase in self-efficacy (Bandura, 1977, 1982).

**Past Performance Accomplishments**

Although efficacy is not constant and varies but often takes inspiration from elements that are based on past experiences (Lane et al., 2002). In fact, previous work experience and the effect is strongest and the most dependent on belief in self-efficacy (Bandura, 1977, 1986). Research evidence suggests that high self-efficacy and low past successful experiences of the poor stems from experiences is effective in different situations and conditions (Lane et al., 2002). Based on this research, we predict that past work experience has the greatest impact on self-efficacy beliefs.

**Vicarious Learning**

Many of our beliefs to self-education will make the experience of others. Seeing the success of others makes one's own abilities to do things the same way and believe in its efforts to encourage permanent. People often compare themselves to others and are convinced that if people would like them to do so they are able to do so. The person dealing with obstacles and problems and to attempt to reach a clearer and more concrete result, a model for dealing with the issues of observer than it will in the future. Since learning cannot find a successor and reflects the observer's behavior in the future is a result of the impact of the barriers are lower than other factors. However it would be useful for people to see the success of others in order to boost their confidence and trust in their abilities (Bandura, 1977).

**Verbal Persuasion**

Verbal Persuasion when one's self from others is encouraged can rise and finish the job in difficult circumstances. Guidance and positive suggestions from others to promote their cause and said something that made them difficult for a person to be led to the successful results.

However, these incentives will affect less than one's own past experiences. Because it was not based on real experiences and personal and therefore may be said to be something that he really did not believe and do not believe it (Bandura, 1977).

**Emotional Arousal**

Emotional arousal and stimulation is another factor influencing self-efficacy. Most people have some degree of emotional reactions are dealing with issues and situations. Negative emotions caused by weakness in the affairs while positive emotions can lead to high performance. Negative feelings are stressful and frightening in person and the other person does not trust its capabilities. Positive emotions can motivate the individual to the successful implementation of the work will make you feel satisfied. Therefore it seems essential that the techniques used to reduce the negative and increase the positive feelings that will increase the level of self-efficacy (Bandura, 1977).

**Career self-efficacy theory to the application of the professions**

Betz et al. (1981) presented the concept of using self-efficacy theory to the career path for career practice. A series of tasks and actions that a person can experience during their life, career is called (Super, 1980). On the other hand, career self-efficacy is defined as people's judgments regarding their ability to perform tasks and jobs and progress in the various situations (Anderson and Betz 2001). Career self-efficacy can be motivating or lack thereof to perform a task or job. Self-down career path makes a career decision to delay or cancel the decisions already taken (Betz, 1992). People who have high self-efficacy for success, demands, and seek their support and positive results have hopes and dreams for their career. Whatever career path is more general self-efficacy, their goals and their struggles to draw a bigger job and promised to have a strong act (Bandura, 1993, 1997). Must struggle with low self-efficacy and change them while high self-efficacy should be supported. In addition to career self-efficacy is considered as the foundation of business success that can affect job behavior, regardless of their skills and knowledge. Nesdale et al. (2000) believe that the issue of career self-efficacy among different cultures is an important factor in the ability of the individual to have that makes the continuation of work.

**Factors influences on career self-efficacy**

Four factors of Self-Esteem have a large impact on the career self-efficacy. Lack of previous experience, training and observation of succession insufficient; lack of verbal encouragement from others in the community such as teachers, parents, colleagues and consultants can have a negative impact on career self-efficacy (Betz and Hackett, 1981). Moreover arousal emotions can positively or negatively affect the career self-efficacy
(Bandura, 1982). Generally, if a person's past, including positive and successful experiences that have gone up and strengthen the job self-efficacy, increased expectations, confidence and scope of his job performance (Super, 1963). Also, low self-efficacy factors of the job can be associated with negative experiences. Therefore it seems essential that positive experiences in relation to occupational factors should be strengthened to increase self-efficacy belief.

DISCUSSION
In view of Bandura's self-efficacy beliefs of one's own abilities achievements in organizing and managing resources to produce the required action has been determined. These beliefs influence the expectations and level of commitment to their level of motivation and perseverance in the face of hardship and adversity to escape. Bandura believes that people's judgments about the level of self-efficacy are based on four sources of information include:

Past experiences, experiences succession or observational, verbal or social incentives and ultimately emotional arousal. Career self-efficacy, derived from Bandura's concept of self-efficacy, the belief in their ability to perform job duties is defined in terms of specific professional. Studies show that the higher the sense of efficacy, to provide a broader range of job opportunities and demonstrates career interests to better.

In contrast, feelings of low self-efficacy may limit the scope of business activities and ultimately will lead to uncertainty regarding job duties.
